USER INTERFACE AND DESIGN

RAD Model UI Design using Figma

AIM

To simulate the lifecycle stages of UI design using the Rapid Application Development (RAD) model and develop an interactive prototype using Figma.

DESCRIPTION

Rapid Application Development (RAD) is a software development model that focuses on quick development and continuous feedback from users. It emphasizes building prototypes rapidly and improving them through iteration.

In this experiment, a food delivery application named **FOODORZ** was designed and developed as an interactive UI prototype using Figma.

PHASE 1: REQUIREMENTS PLANNING

Features Identified:

- Home page with food display
- Food categories (Burger, Pizza, etc.)
- Product details page
- Cart and checkout page
- Order confirmation screen

User Actions:

- Browsing food items
- Searching food items
- Viewing product details

- Adding items to cart
- Placing an order

PHASE 2: USER DESIGN

Wireframes Created:

- Home Screen
- Food Menu Screen
- Product Details Screen
- Cart Screen
- Order Confirmation Screen

Design Activities:

- Designed layouts using buttons, images, and text
- Organized UI elements for better user experience
- Added navigation elements between screens
- Created basic interactive prototype using Figma

PHASE 3: CONSTRUCTION

- Developed a complete interactive prototype
- Connected all screens using clickable buttons
- Implemented navigation flow between pages
- Tested the prototype using preview mode
- Improved the design based on usability

PHASE 4: CUTOVER

- Finalized the UI design
- Shared the prototype using Figma link
- Prepared the application for demonstration

OUTPUT

The developed UI prototype consists of multiple screens such as Home, Food Menu, Product Details, Cart, and Order Confirmation for the FOODORZ food delivery application.

RESULT

Thus, the UI design of a food delivery application (**FOODORZ**) was successfully developed using the RAD model and implemented using Figma.
